## P R E F A C E.

---

In a treatise professing to teach the practice and principles of change ringing, it may probably be expected that many minute details relating to its history and progress would be given, but as these are matters more of curiosity than real utility they cannot consistently be carried out in the limited number of pages in this work. The origin of change ringing cannot be traced to any remote antiquity, for notwithstanding we have records of peals of bells as early as the ninth century, it does not appear to have assumed any scientific feature till the seventeenth, from which period it has been gradually matured. In its present improved state, perhaps there is no amusement requiring the employ-

ment of more faculties mental and physical than the art in question; for whilst the mind is occupied with the intricacy of the method, the hands are actively employed in the proper command of the bell, the dexterous management of which forms a very essential part in the art treated on. However acute the ear and unclouded the practitioner's intellect might be, yet if he was deficient in this point, he could never attain that degree of excellence necessary to constitute what is termed a fine striker\* in change ringing.

The eye has also an important part to perform, as the bells are met indiscriminately, the particular one to strike after must be ascertained by sight, whilst the ear assists in regulating the time of the stroke, or adapts it to the compass the bells are ringing in.

\* It is almost incredible how extremely small portions of time are forced upon the observation in change ringing. Assuming a quarter of a second to elapse between the striking of any two bells, (which supposition is very near the truth,) it will appear that an error of a quarter of that space too quick or too slow would be distinctly felt and heard by an experienced ringer, and hence the sixteenth part of a second becomes an appreciable quantity.

It is therefore manifest that in proportion as the practitioner's faculties are complete in these particulars, so will his attainments be as a practical ringer. It has required many years' labour and patient investigation to bring the science to its present state of refinement; some eminent men of the old school who greatly contributed to this were Anable, Holt, and Reeves, and many among the moderns whose names are conspicuous in these pages; their productions are highly creditable to the minds from which they emanated.

As all scientific acquisitions are progressive, it was not unreasonable to conjecture that great improvements had been made in the higher branches of the science. As nothing material has been published for a period of nearly forty years, I was desirous of giving publicity to them; in order to do this I communicated with some of the most able composers in London and other places of celebrity, the result has been many of those gentlemen furnished me with copies of their productions for in-

sertion. The great improvements made in Treble Bob Major and its complex variations, and also in Stedman compositions, will no doubt be well received and appreciated by those persons who are conversant with the great labour and difficulty involved in the true attainment of them.

I trust what has been said relative to the two courses of changes will be approved and generally understood ; that which has hitherto been considered a mysterious and intricate subject is, I apprehend, rendered as easy and familiar to the understanding as can well be desired. It will be sufficiently clear in the case of transposition by four or any multiple of four that the course remains unaltered ; it being only reduced to a simpler form, or in other terms, brought from a change with which course you are supposed to be unacquainted to one that is actually known.

Considering the number of pages and the quantity of matter embodied in this Essay, I think it may unhesitatingly be said to contain the most copious and

valuable collection of peals yet published, and its cheapness is certainly unprecedented in the history of change ringing.

I will not fatigue the reader with much preliminary matter as a multiplicity of words sometimes have a tendency to obscure the subject. I shall, therefore, merely observe that to facilitate the progress of young practitioners I have laid down the rules of each method in as concise a manner as is consistent with perspicuity ; making such additional remarks when required as I imagined would be most conducive to that end. I have also consulted the ease and convenience of the young bob-caller, by giving the productions in regular parts, whenever it could conveniently be done without being detrimental to the music of the peal.

My principal aim in this Essay was to unite harmony with simplicity and truth; how I have succeeded must be left to the discrimination of the exercise at large. It only remains for me to thank those gentlemen (amateurs

and professors) who have done me the honour of countenancing the publication by their support, and trust they will find the confidence reposed has not been misplaced, as I believe the conditions announced have been literally fulfilled ; under this impression it is submitted to the exercise to stand the test of the reasonableness of its precepts and the truth of its examples.

H. HUBBARD.

## INTRODUCTION.

---

*The favourable reception the former impressions met with, induced the present publication; in which is introduced a variety of new compositions which will be found both musical and entertaining.*

*Several Reverend gentlemen and public teachers have expressed their approbation of the work, and consider the science of church bell ringing an exercise well calculated to improve the mental and physical powers of the young persons under their tuition; more especially as its practice and principles are founded upon harmony and mathematical truth.*

*The facilities afforded to young practitioners is manifest, as the Author has successfully taught from its pages various companies of men to become proficients in the art. In order therefore to give it greater publicity, the price has been reduced; which circumstance will have a direct tendency to extend its circulation and render the principles of the science more generally known.*

Leeds, Jan. 1868.

# ELEMENTS OF CAMPANALOGIA.

---

In consequence of the limited number of pages in this work, it is requisite to omit such peals as are not in general practice, such as the reverse methods, which may be considered nearly useless, they not being rung, probably because the direct and double methods are much superior: it would therefore be inconsistent with the plan of conciseness and general utility to insert them.

A copious selection of the best and most popular methods in practice will be presented, which, doubtless, will be sufficient to gratify the tastes and meet the expectations of the most persevering practitioners. The student will see by the following table the number of changes afforded by any given number of bells to twelve inclusive which must be equal to the continued product

of the figures representing the number of bells, as shewn in the horizontal lines beneath; but the method of producing them conformably to the rules of the science will be shewn further on.

As all peals of bells, whose number exceed three, are composed of a determinate number of whole and half-notes, a dash is placed between the figures where the semitones lay:—

1 2	—	2
1 2 3	—	6
1-2 3 4	—	24
1 2-3 4 5	—	120
1 2 3-4 5 6	—	720
1 2 3 4 5 6 7	—	5040
1-2 3 4 5-6 7 8	—	40,320
1 2 3 4 5 6 7 8 9	—	362,880
1 2 3-4 5 6 7-8 9 10	—	3,628,800
1 2 3 4 5 6 7 8 9 10 11	—	39,916,800
1 2-3 4 5-6 7 8 9-10 11 12	—	479,001,600

I shall now proceed to lay down some instructions for the young practitioner. His first acquisition should be to make himself master of ringing a single bell, in the management of which he ought to be very expert before he attempts anything further; he should ring it with a steady, smooth pull, bringing it to a balance as nearly as possible, in order to be able to hold up or cut down, as occasion may require. When he has acquired a tolerable sleight of ringing a bell,

it would greatly forward him, if an experienced ringer were to assist him on two bells thus:—  
 1 2, 2 1, 1 2, &c, by this means he would get a good idea of pulling after a bell, holding up and cutting, which evolutions are highly necessary before he can make any progress in change ringing.

The practitioner having arrived at this, he may next proceed to ringing of rounds upon four or five bells, as may be deemed most convenient. Here it is necessary to offer some observations respecting the time or compass of ringing in general. The most natural way appears to be, by representing time by space or distance, thus; supposing the learner to ring the treble on five bells for instance, he should lead off at the hand stroke and bring her off the back stroke in the same time or distance the other bells strike from each other, and should allow twice the said time when he leads at the hand stroke, which may be understood thus:—

Hand stroke,	Back stroke,	Hand stroke,	Back stroke,	Hand stroke,	Back stroke,
1234512345, 1234512345, 1234512345, &c.					

The learner will see by the foregoing figures, that he invariably leads slow at the hand stroke and quick at the back stroke, and he must bear it in mind that this is a general rule upon any

number of bells, and in changes as well as rounds ; for it is this distinction or open lead at the hand stroke that gives a bold and striking effect to the ringing, and makes it very pleasing to hearers when neatly performed.

There are good reasons for putting the learner to the treble ; first because that bell being what is termed a plain hunt, its work is much easier than any other bell's work ; again, because the bells are rung in rounds many times before and after the changes, it affords him an opportunity of learning to make well-timed leads ; for if he can strike his bell in true time at leading he will find little difficulty in timing it in any other place, for good even ringing depends much upon the accuracy of the time sustained by the bell at the lead.

*Hunting* being the first part of ringing which is necessary to be understood, and indeed the groundwork on which it is founded, the learner will do well to make himself master of it before he attempts any more difficult part of the science. Having already supposed him to be ringing the treble in rounds, and standing in such a position as to command a sight of all the ropes, the first change he must strike into second's place by pulling after the one which followed him ; he will now have one below and three above him, when his attention must be directed to

the three above him to see which is following him, and pull after that the next time; now counting himself to be in third's place he will have two below and two above him, still observing the two above him to see which follows him, and pull after that the next time; he will now count himself to be in fourth's place, having three below him there will remain only one to look after, which he will pull after the next time, this will be his first blow behind; now having four below him, he must follow the last of them, this will be his last blow behind. He must now descend into fourth's place by letting the last one he pulled after pass him, and pull after the last of the three below him; the next blow he strikes in third's place, allowing the last he followed to pass him, and pull after the remaining two below him; he next descends to second's place, making way for the last he followed to pass him, by pulling after the remaining one; he will now be at the lead again, from whence he started, where he leads two blows, and hunt up and down in the same regular manner—step by step as before.

There is another point which I wish to impress upon the mind of the learner, that is, in hunting up his bell will require to be rung much higher than when hunting down to lead because when hunting up he has to wait for five

bells striking, but when hunting down he has to wait only for three, hence the cause of the difference is manifest. It is further observed, this difference is inversely as to the number of bells, the ratio in the present instance being as five to three ; on eight bells as four to three ; and on twelve only as six to five.

Dodging and place-making, the other two parts constituting the practical part of the science, now require and explanation, as it will be often necessary to refer to them.

*Dodging* is nothing more than making a retrograde motion, or moving a place backwards, and then going on the same way as before ; thus, supposing the practitioner to be hunting his bell up till he counts it to be in fourth's place, then instead of striking the next blow in fifths, he must cut down into third's place, and then proceed through fourth's up behind ; this is called dodging in three-four going up. Again, supposing him to be hunting down until he counts himself to be in third's place, he must hold up and strike in fourth's, whence he must pass through third's and second's down to lead, this is called dodging in three-four going down because it is performed in the places of the third and fourth bells in the order of rounds, and the same of any other places where the dodging occur.

*Place-making.*—A bell is said to make a place when it lies two blows in succession in any place excepting before or behind, that being considered in the work of hunting.

Having explained all that is necessary for the present, I shall now commence the changes on three bells, the other numbers following in regular order.

<b>123</b>
<b>213</b>
<b>231</b>
<b>321</b>
<b>312</b>
<b>132</b>
<b>123</b>

On three bells the changes run out by the process of hunting only, but four bells comprehend the three articles enumerated. The first four-bell method is the plain, the second the double, which will be all that is requisite on this number.

31452	31452	41532	31452
34125	34125	45123	34125

In Bob Doubles all the bells hunt until the treble leads, when the bell it takes off the lead make second's place and lead again, and the bells in three-four dodge; the bell behind lies two blows extra, having no bell to dodge with. If

a bob is called, the bell instead of making second's place, runs up quick, and the bell that laid to dodge in three-four down, runs down quick, and that which would have dodged in three-four going up makes fourth's place and down to lead. This peal is sometimes rung by what are termed *extremes*, which are made thus : the bell that laid to dodge in three-four going down makes third's place and up, and that which should have dodged in three-four going up runs out behind, and the bell behind instead of lying four blows, lies only two, and hunts down to lead.

---

## GRANDSIRE DOUBLES.

In this method the bells have a direct hunting course till the treble leaves leading, when the bell it took off the lead makes third's place and down, and the hindmost bells dodge; but when a bob is made, the bell that strikes the treble in second's place makes third's and down, and the bells behind dodge, which is immediately followed by the regular dodge. A single has the same effect as a bob on the bells behind, but the bell that strikes the treble in second's lay four blows in third's and down to lead, when the bell the treble took off the lead makes second's place and lead again.

The practitioner, when ringing the Double Grandsire, will have to observe when the treble turns him from behind, to make third's place and back, when the bells before will make a single dodge, coinciding in every respect with the work when the treble is before.

---

### ST. SIMON'S DOUBLES.

The two bells the treble leaves before, in this peal, continue dodging until it comes down and part them, for which reason, the bell from behind makes third's place and back ; and the bell the treble takes the lead of, make second's place and lead again, which cause the bells in three-four to dodge, and the bell behind to lay four blows as in Bob Doubles.

---

### NEW DOUBLES.

Although more intricate, this peal is similar to the preceding as respects the bells dodging before till parted by the treble, and the bells from behind making third's place and back ; but here are two extra third's places : namely, the bell when the treble takes the lead which goes up, and the bell when it leaves the lead which goes down. The bells behind strike only one blow, except the bell the treble leaves behind,

which lies a pull and strikes one blow in fourth's place repeatedly till the treble comes up and turn it from behind ; the bell the treble takes off the lead makes second's place and lead again as in the preceding peal. The bobs and extremes are made as in Bob Doubles.

New Doubles.	Stedman's Slow Course.	Double Stedman's Slow Course.

32154	24135	23154
31245	21453	21345
13254	12543	12354
13524	15234	13254

### STEDMAN'S SLOW COURSE.

It must be observed in ringing this peal, the bell that takes the treble off the lead, leads a whole pull and strike one blow in second's place repeatedly till the treble takes it off the lead, then hunts up behind ; the bell before with it leads one blow, makes second's place, and lead another blow, then hunts up behind ; the former is called a whole-turn bell and the latter a half-turn bell. Now it is clear that when these two bells are before, those from behind must make

third's place and back, which may be known by the treble being above third's place.

In ringing the Double of this method, the practitioner will, in addition to the foregoing rules, have to notice when the treble is behind, as whole and half-turns are done behind in a similar manner as before in the single method. The courses of these peals are produced by repeating the given leads twice or thrice, according to the number of bells transposed at the back stroke lead of the treble. The Grandsire methods having two plain hunts the courses are shortened one lead.

---

### STEDMAN'S PRINCIPLE.

This method derived its name from the circumstance of its having been composed by Mr. Fabian Stedman, and it is unquestionably a master-piece of all five-bell peals, as it is also upon all odd bell methods. If the learner has perused the foregoing methods he must have seen the treble has been the guide in all of them but in this, each bell has the same work to perform, which consists of a slow and quick bell down alternately, for which reason, the lesson of what is termed the slow work must be committed to memory, which is as follows : taking the fourth bell for example, when coming from behind it makes third's place, down and leads a whole pull, strikes one blow in second's and

leads another whole pull, this is called the first whole turn ; it then makes third's place and down, lead one blow, which is the first half-turn ; it next makes third's, down, and lead another blow, this is the last half-turn : it then makes third's place again, down, lead a whole pull, one blow in second's and lead another whole pull, this is the last whole turn ; whence it makes third's place and up, which complete the slow work. The bells above third's place always dodge twice before and after laying the pull behind. The work of the quick bell is nothing more than hunting down and leading a whole pull, then hunting up and commence the dodging as before described. That the young practitioner may be able to trace the work, and thereby more fully to comprehend these instructions, the full course is given,

135264	156342	135264	156342

## BOB MINOR.

In this peal all the bells have a plain hunting course excepting when the treble leads, when the bell it takes off the lead makes second's place, for which reason the bells above make a single dodge. To ascertain when the treble is at lead, is by the place it is met in, thus : supposing a bell in going up passes the treble in two-three, that bell must dodge in three-four going up : and if it passes it in three-four, it dodges in five-six before laying the pull behind ; but if it meets it in four-five, it must dodge in five-six after laying the pull lastly, meeting it in five-six, the dodge must be

made in three-four going down. There is another rule rather more commodious, and of more general use as it serves for any number of bells ; it is termed the course method. After laying next the treble, to dodge in three-four going down, the next lead in five-six after laying the pull, then in five-six before laying the pull, next in three-four going up, and finally laying next the treble again.

In the Double Bob method, attention must also be directed to the treble's being behind, at which time the four foremost bells dodge, and the bell the treble turns from behind makes fifth's place and return.

The plan of making the bob has already been explained under Bob Doubles, and the single is made by the two bells in third's and fourth's places lying still.

---

### COURT BOB.

This first method of Court is so extremely simple in its composition as to require but little to be said upon it. The bell the treble takes off the lead makes fourth's, third's, and up; the fourth's place causing a dodge upon the two hindmost bells, and the third's place a dodge on the two bells the treble leaves before.

In the Double method, fourth's and third's are made from before as in the foregoing peal, and in addition, third's and fourth's from behind; these conditions combined, cause single dodging before and behind, before and after leading and laying the pull, except when the treble interferes. that being plain hunt, no bell can dodge with it.

The bob is made in fourth's place, and the two bells behind dodge till parted by the treble; and when a single is made, the two bells in second's and third's places lay still.

153624	146253	165432	153624
156342	142635	156342	135642

### OXFORD BOB.

In this peal the bell going up passing the treble in two-three, dodges in three-four, makes fourth's place, and down to lead; it will also

after passing the treble in three-four, make fourth's place again, dodge, and go down to lead. The two bells the treble leaves behind, dodge till it comes up and part them; and the bell the treble takes off the lead, make second's place and lead again.

When ringing the Double method, the two bells the treble leaves before continue dodging until parted by her, and the bell passing the treble in two-three makes fourth's and third's, dodging before and after, then proceeding upwards; the bell the treble takes off the lead makes second's place, as in the Single method.

Adopting similar rules from behind is all that is requisite in this peal; the bobs and singles are made as in Bob Minor.

### STEDMAN'S SLOW COURSE.

The principal difficulty in this peal consists in doing the whole and half-turns correctly, (see Stedman's Principle.) There are two whole turn bells and a half-turn one; the bell the treble takes off the lead does a whole-turn, makes third's place, and up: and that which strike the treble in second's place does the half-turns; when the one in course after it, meeting the treble in three-four, makes third's place, down, and does the other whole-turn; the two parted from behind

by the treble making fourth's place and return, then hunt down quick

This Double method the practitioner will find rather intricate, it having whole and half-turns behind in addition to those of before : when to make them are indicated by meeting the treble in corresponding places from behind, as it was met in from before in the Single method. There is another circumstance in the double, that is, the bell the treble takes off the lead, makes third's place and commence half-turns before ; in uniformity, the bell the treble turns from behind, makes fourth's place, and do half-turns behind. The bob is made on the three hindmost bells and the singles as in Court Bob.

---

Having concluded peals with the treble plain hunt, the next that are introduced to the practitioner's notice are called Treble Bob peals ; the term, no doubt, derived from the peculiar motion of the treble, which consists of dodging before and after leading the pull ; it dodges also in three-four, and before and after laying the pull behind ; in consequence of which one treble lead has as many changes as two leads where the treble is a plain hunt. In these, the necessity of singles are superseded, the effect of them being produced in the regular work.

## OXFORD TREBLE BOB.

In this method, the practitioner will observe, there is a bell called the slow hunt, performing thus:—it dodges with the treble, leads a pull, makes second's place a pull alternately till the

treble comes down and dodge with it again. The next thing to be observed is, third's and fourth's places are invariably made when the treble is dodging before, which are known thus ; suppose the practitioner to be coming from behind, immediately he gets in three-four ; if the treble is below, he must make third's place and up ; if he is in three-four going up, with the treble below, then he must make fourth's place and down ; the bell that made the first fourth's place goes into the hunt, and that which left the hunt makes the last fourth's place. When a bob is made, the bell that makes the first third's place, immediately makes fourth's, which causes it to make the last third's place also, whence it goes up, and the two hindmost bells make two dodges extra.

---

### KENT TREBLE BOB.

This peal is similar to the preceeding, it only differs from it in making the places ; if going down, instead of making third's and back make fourth's, third's, and down ; if going up, instead of making fourth's and back, make third's, fourth's and up. At a bob, the bell making third's and fourth's, immediately makes fourth's and third's and down to lead.

## COLLEGE EXERCISE.

This peal resembles Oxford Treble Bob, till the treble dodges behind, when the bells in three-four lay still; moreover, fifth's place is made when the treble is full behind, which retain the same two bells in three-four, and cause them to lay still at the last dodge of the treble, whilst the two bells before make a triple dodge; the slow hunt then leaves, and the bell that dodged with it assumes the hunt for the remaining part of the lead. The place-making in three-four at the dodging of the treble before, and the seconds, place at the time of her full lead, cause triple dodging on the two bells behind. The practitioner will see, in those peals where second's place is made at the treble lead, the bob is made in fourth's place, and the bells before run quick.

---

## IMPERIAL.

This and the three following peals, the practitioner will find very intricate, and previous to attempting them, it would be well to make himself acquainted with the work of each bell throughout the given lead, so that, in ringing, when he comes to the lead end, he may be enabled to proceed with the work of any bell in whose place he may happen to fall. Pursuing

this plan in each lead successively, until he ultimately falls into his original position again. These are infallible rules for these or any other methods ; but, most probably, practice and observation will suggest rules less burdensome to the memory, more particularly when practising these complex variations upon a higher number of bells.

After the instructions given for these methods upon five bells, it would be useless to trouble the practitioner with any further comments, as he will readily see, by the treble leads before him, notwithstanding there are two additional bells, that the work is similar, and must be rung by referring to where he meets the treble, or by the course method, as described in page 15.

## STEDMAN'S PRINCIPLE.

6347251	7452136	6754123
3642715	4751263	6571432
3467251	4572136	5674123
		&c.

This peal is founded upon the principle of Stedman's upon five bells, the slow work, dodging, &c., being in every respect the same; the only difference necessary to be explained is making the bobs and singles, which are generally upon the three hindmost bells at the parting of the sixes.

At a bob, the bell dodging in four-five going up makes fifth's place, when its position is immediately changed to that of four-five coming down at which time the two hindmost bells dodge six changes extra, (see the treble and fifth,) which alter their course in going quick or slow, inasmuch as the treble will go down

again quick, and the fifth slow, and *vice versa*. The way to ascertain whether to go down quick or slow; is to observe how your course bell go down and go contrary. In the example before us, the fifth is course bell to the treble, and the second course bell to the fifth ; now supposing you are dodging in four-five going down, and strike your course bell the first blow in fourth's place, it has made third's and gone slow, then you must go quick ; but if you do not strike it till the last blow in fourth's, it has been quick, then you must go slow.

There is another method, independent of the course bell, which cannot easily escape the practitioner's observation, and it will be very useful upon higher numbers ; that is, when going down he will readily perceive the bells that have been quick from those that have been slow, by the time and positions met in when going up, then if he dodges with any bell that has been quick, must go quick too ; if he passes them without dodging he must go slow. When a single is made, the bell dodging in four-five going up, does the same as at a bob ; and the bell that has completed its last dodge behind, makes sixth's place and recommence the first dodging position again, because that in seventh's place is not affected by the single, but proceeds with the work as though there had been none called.

12527486	15738264	13768542

The first and second of the preceding methods are so similar to Plain and Double Bob Minor that it is unnecessary to make any further remarks upon them, as an examination of the given leads will be quite sufficient for the student's purpose, when he can adopt the rule of ringing either by meeting the treble or the course method according to that he considers most familiar to him.

---

DOUBLE LONDON COURT BOB.

This method consists of single dodging before and behind, before and after leading and laying the

pull, unless the treble interferes, when of course the dodge must be omitted. The place-making is thus: the bell the treble takes off, he lead, makes sixth's, third's, & sixth's, and hunts down after her; and the bell she turns from behind makes third's, sixth's, & third's, and hunts up after her.

The bob is made upon the three hindmost bells, thus: the bell going to make sixth's place, instead of so doing, runs quick out behind, for which reason the two hindmost bells omit the dodge; and the bell that falls into sixth's place finishes the place-making of the bell that was called up.

15738264	18674523	14263857

## NORWICH COURT BOB.

To ring this method it must be observed, the bell the treble takes off the lead, makes fourth's and third's, dodges in three-four, and hunt up behind ; and that passing the treble in two-three, dodges in five-six, makes sixth's, fifth's, and up ; whilst the places are making, there is double dodging before and behind : the bell that falls into sixth's place at the lead end, dodges in five-six and three-four in its way down

In the Double method, places are made from behind in addition to those of before, namely, the two bells which the treble parts from behind, make third's and fourth's, fifth's and sixth's, dodge, &c. ; these extra conditions cause regular dodging before and behind, except the treble interferes, when it is necessarily omitted. The bob is made on the three hindmost bells, thus : the bell dodging in five-six going up, makes sixth's place, and the two bells behind continue dodging till the treble parts them.

Notwithstanding this Double Court is full of work, the practitioner can simplify it by considering that the two bells which the treble

parts from before or behind are the place-making bells, and those it leaves before or behind are the dodging bells.

---

### DOUBLE OXFORD BOB.

Those practitioners who are experienced in the preceding method will find but little difficulty in performing this, the extra dodging being occasioned by the additional places, second's and seventh's, when the treble is before and behind, which will be evident by comparing the work of a treble lead of one with that of a treble lead of the other.

The practitioner will see by comparing the Oxford and Kent Treble Bob methods with those upon six bells, that such similarity exists as to render any more instructions upon them unnecessary, the slow hunt, place-making, &c., being the same.

---

### I M P E R I A L.

To ring this method, and more particularly the three following Surprise peals, will require much skill and well-directed practice in the individuals who attempt them. The experienced practitioner will, by an examination of the given leads, be enabled to form more definite ideas of the rules to be adopted in ringing them than any written statement could possibly convey, which must of necessity be long and complicated : besides it would occupy more space than could consistently be devoted to this part of the subject, without furnishing an adequate degree of utility.

The foregoing methods so nearly resemble those given upon seven bells, that it would be useless to trouble the reader with any remarks upon them, but commence immediately on the next number of bells; now having the nine digits employed, it will be expedient to adopt three additional characters as representatives of 10th, 11th, and 12th, for to avoid confusion, each bell must be known by a single character, 0, x, & z, are therefore selected for the purpose.

---

### ROYAL,

#### OR METHODS ON TEN BELLS.

As the Plain, Double, and Treble Bob methods upon ten bells are so easily derived from those given on eight, they are for that reason omitted in this place; but as the Courts differ materially on each number of bells, the following leads are inserted for the practitioner's inspection.

The Double method being considered rather intricate, a few hints relating to its practical rules may not be unacceptable to the young practitioner.

The work of this peal consists of single dodging before and behind, both before and after leading or laying the pull except the treble interferes. The places made from before are fourth's and third's, and eighth's and seventh's; the former are made by the bell that the treble takes off the lead, and the latter by the bell meeting her in two-three; in both cases the

place-making bells dodge in five-six : a similar rule is to be observed from behind, *i. e.* seventh's and eight's are made by the bell the treble turns from behind ; and the bell meeting her in eight-nine, makes third's and fourth's, each dodging in five-six, as observed of those from before. The next point is, any bell that is not concerned in the place-making, invariably dodge in two places, which depend upon the position the treble is in ; therefore knowing where to omit the dodge, previous to meeting the treble, is of much importance. which is thus : the bell that takes the treble off the lead, omits the dodge in seven-eight ; the next bell from before omits it in five-six ; and the third from before omits it in three-four ; and in like manner from behind.

The bob is made on the three hindmost bells and the dodging is similar to Court Bob Minor.

The first method of Court will be found very simple in its construction. The bell which the treble takes off the lead, makes fourth's, third's, and up; the fourth's place causing the eight uppermost bells to make a single dodge, and the third's place a single dodge upon the two bells the treble leaves before.

In the second method the additional places, ninth's and tenth's, are made by the bell which the treble turns from behind, the former place causing single dodging on the eight foremost bells, and the latter, a single dodge upon the two bells which the treble left behind.

---

### NORWICH COURT BOB.

In this peal, the bell which the treble takes off the lead, makes fourth's and third's, and that meeting her in two-three, makes tenth's and ninth's, the former places causing a single dodge on the eight uppermost bells, and also upon those two bells the treble left before ; but when the latter places are made, a dodge is made on the two bells behind, which is immediately followed by a single dodge upon those eight bells below.

---

### DOUBLE NORWICH COURT BOB.

The ringing of this peal is so extremely intricate as to render it impossible for any but the most experienced practitioners to accomplish it, that to attempt to lay down rules for its performance might be deemed impertinent and unnecessary. The writer is well aware that

those persons, by merely inspecting the method know how to deal with it quite equal to the most elaborate instructions that could be given upon that part of the subject.

---

The student having progressively gone through the elementary part, from whence the practical rules of ringing are derived, his attention will now be directed to the principles of the science ; namely, composing, proving, and calling peals, the particulars of which will be inscribed in the following sheets ; but previous to this it is requisite he should be apprized that upon any number of bells there are half the changes which are termed in course, and half out of course ; the former division are of the same nature as the round, and the latter diametrically opposite to it, *i. e.* such as will come only within two bells of round, or can be brought to that state by transposing by fours, which have the effect of retaining them in the same course they were in the preceding change, as the following examples are intended to show.

**In and out of course of the changes.**

	1253746 in	51728364 in
		15273846 in
		12537486 out

By referring to the third example, the fact of four bells changing not altering the course is sufficiently established, as every change is in course; but in the first and fifth examples, the reverse case manifests itself; namely, if two or six bells change, it alters the course inasmuch as each change is alternately in and out of course. The second and sixth examples are also alike in their operation, showing that two and four bells changing alternately, have the same effect as six and eight changing in the same manner. From these simple principles the following inference is drawn; if four, or any multiple of four, change places, the change is retained in the same course; but any number changing that is not divisible by four without a remainder, put them out of the course they were in the preceding change. In the same manner it may be shewn from the fourth example, that six and ten bells are similar in their effect.

When the student has made himself acquainted with these particulars, he will be enabled to ascertain the state of the two courses of changes in any method whatsoever, on which is founded the only true basis of composing and proving the truth of peals.

### On the Terms Bob and Single.

The term bob, in its general acceptation, denotes an alteration in the course of the bells, which in some methods will carry out the changes to the extent admitted by the number of bells; but in other methods, when the in and out of course changes are differently disposed, it is necessary to have a single to turn the course of the changes; see Example 3, where every change is in course, and consequently not any of the half out of course could be obtained without this alteration; namely, reversing the work of two bells. Each of those alterations will be distinctly noted; the bobs by a dash (-) and the singles by the letter (s) immediately opposite the changes to which they apply.

Commencing with the following peals in the plain method, which are each divided into three equal parts, the practitioner must observe that the time for calling is when the treble strikes into second's place, prior to coming to lead, in order to give sufficient time to prepare for making the bob. These are given by the back stroke leads of the treble, which being so understood it would be superfluous to introduce it.

## DOUBLES,

OR COMPOSITIONS ON FIVE-BELL METHODS.

## PLAIN BOB.

120	120	120	120
3524	3524	3524	3524
5432	5432	5432	-3542
4253	4253	-5423	5234
s2453	-4235	4352	2453

Each twice repeated.

These peals will serve for Simon's and New Doubles.

## GRANDSIRE.

120	120	420
2534	2534	2534
3425	s4325	-3425
3542	4532	3542
4235	-3245	s2435
4523	3524	2543
s3245	-2435	-4325

Each repeated.

This method having a bell in the hunt with the treble, the bobs and singles must be called one change sooner than in the foregoing peal. The same rule applies to all Grandsire ringing.

## STEDMAN'S SLOW COURSE.

120	120	120
-4253	5234	5134
3425	s5423	-3542
5342	s5342	-4325
2534	2534	-2453

Each twice repeated.

In the above method, it is requisite to call the bobs as in Grandsire ringing, but the singles one change later,

## STEDMAN'S PRINCIPLE.

120	120	120
12345	12345	12345
21345	21354	21354

143562	135426
125436	135264
125364	

The last peal inserted in this method is on a peculiar plan, by that eminent composer the late Mr. John Holt, of London. He has produced it without singles by calling the treble into the bobs; the first bob in which the treble is concerned, it dodges behind, which, by adding two changes to the lead, put the treble leads out of course, in which state they remain till she dodges behind at her third bob, which also adds two changes to the lead, and put the treble leads into their original state. The second bob in which the treble is concerned, it makes fourth's place, which shortens the lead four changes, counter-acting the four changes added by her two dodges. By referring to the rules in page 42, it will appear that this method has alternately two changes out, and two in course, consequently when the treble makes a dodge, thereby adding two changes to the lead, that her leading must be thrown out of course: hence the effect of a single is produced.

If the bells happen to get misplaced, they may be called round by the following rule: if all apart, call the fifth up till the tenor dodges behind prior to laying her pull, which will bring the tenors together; the next lead, see whether the changes are in or out of course; if in course, call the fifth down till the third makes fourth's place, when the bells will be in

plain course ; but if out of course, call the fifth down till the fourth make fourth's place, and they will come round with a single. From this example, the practitioner may arrive at the plan of calling other peals round, as it would occupy too much space to dwell upon this in the other methods.

The following are the first part of each peal in the various methods with the treble plain hunt, which, being twice repeated, completes the first half, when by calling a single and repeating, the 720 changes of each will be produced. (See Bob Minor.)

The Double Stedman's Slow Course is an exception to this rule ; the singles must be omitted at the half-way and end.

## VARIATIONS OF TREBLE BOB.

The following are the first part of each peal of the Treble Bob methods, each of those are to be twice repeated to produce the 720; and as the Oxford and Kent methods have the plain and bob leads of the former like those of the latter,

the same calling will do for either. The usual way of this is by calling the tenor in and out of the hunt, unless the fifth is with her; but a variety of peals may be obtained by changing the observation bells. The other peals having a bell lay next the treble at the plain lead, will require to be called when the tenor is behind without the fifth, similar to the half-peal of Bob Minor.

**TRIPLES,**

OR COMPOSITIONS ON SEVEN BELL METHODS.

**PLAIN BOB.**

To call two courses, with the seventh the observation, a bob must be called when she dodges in five-six, either going up or down, and when laying behind ; and for five courses, call when she dodges in five-six both up and down ; for another touch of five courses, call the two foregoing places, and when she lays behind ; this, in the language of the belfry, is termed, middle, wrong, and home.

The two examples of treble leads contain respectively, the Queen's and Tittum changes, they are in three equal parts. The meaning of Queen's and Tittums is ; in the former the bells are in the position of chords of thirds, and the latter in chords of fifths.

745263 2	267534 1	
567432 4	342756 1	
5243	423756 2	
	354267 4	

The twelve 7-4's.

The twelve 4-6's.

Each of the preceding touches are in three equal parts, which will be seen by observing the part ends where 4, 6, 7 are at home; these are given by the back stroke treble leads, as examples for young practitioners. The 5040, by Mr. Holt, is similar to his peal in the single method, the principal difference consisting of an additional bob with the observation bell before.

midway    { 325476              324567  
               235476              234567 } end.

## STEDMAN'S PRINCIPLE.

To call two courses of this method, two bobs in succession in any part of the course repeated does it ; for three courses a bob upon any three bells twice repeated ; and for five courses a plain six between two bobs four times repeated. The following are given by the last change of each six as examples for the young practitioner. As the sixes are not generally commenced from rounds but from the second change, 2314567, it is placed at the head of the column to commence pricking from.

60	77	84	94
2314567	2314567	2314567	2314567
-3425167	s3425176	3426175	3426175

Each twice repeated.

P.S. P.E.

6354271

Four times repeated.

The three following are quarter-peals, the first having the six-seven ten times the wrong way and five times the right. In the second, the seventh and fourth are together behind fifteen times : and the third has the six-seven fifteen times right containing Tittums and Queen's, the latter immediately following the former. These are composed in five equal parts The second and third are so simple in their construction as to be easily comprehended by the young bob-caller Taking the second for example, by observation of the seventh, it is called thus—

Last whole turn, first bob.

First whole turn, second bob.

Down slow a double, third and fourth bobs.

Down quick a double, fifth and sixth bobs.

which completes the first part. The sixth is the observation bell in the third, and it runs thus:—

Down quick a double, first and second bobs.

Last whole turn, third bob.

First whole turn, fourth bob.

Double slow a double, fifth and sixth bobs.

H. H.

The last change of each part of the three touches is given, for, when conducting, the bob-caller should at least make himself acquainted with the part ends, and, when more experienced, such particular course ends as will enable him to ascertain whether the work is going on correctly.

The next is a complete half-peal, divided into five equal parts, the production of a gentleman who was a great lover and patron of the art inasmuch as he (at the expense of several thousand pounds) erected a splendid tower in his park,

which he furnished with a peal of twelve bells upon which he used to practice his interesting and favourite amusement.

J. P. Powell, Esq., Quex Park, Isle of Thanet, Kent.

The following is an ingenious production of Mr. T. Tharstan, Birmingham given by course-ends. It contains 240 bobs and two common singles; the latter called at Nos. 14 and 2.

\* This half-peal was rung in Norwich upon handbells, [retained in hand,] by four of St. Peter's company, in 1831, conducted by Mr. S. Thurston. Its truth was attested by competent judges with the sixes before them. Time of performance, 1 hour 17 minutes by the following persons.

S. Thurston, treble & 2nd  
H. Hubbard 3rd and 4th

F. Watering, 5th and 6th  
J. Hurry, 7th and tenor.

† This course has 26 sixes.

‡ This consists of 2 sixes.

\* This peal was rung by the Society of Norwich Scholars, in 1853, a t  
 St. Michael's Coslany, conducted by Mr. C. Middleton. Time of performance 2 hours and 57 minutes.

**MAJOR,**

OR COMPOSITIONS ON EIGHT-BELL METHODS.

**PLAIN BOB.**

As the touches and peals in this method will, generally, be given by course-ends, it will be expedient to show the young practitioner the position of the tenor at the bobs which produce them : they are known by the terms, *wrong*, *before*, *middle*, and *home*, which are as follows :—

W.

B.

M.

H.

12357486, 17864523, 16423857, 14235678 ;

and when he sees course-ends represented by five figures, must understand that the treble and the large bells are at home, *i. e.*, in their own places, in reference to the order of rounds. These conditions premised, I shall give the table of course ends and commence the touches.

**TABLE OF COURSE ENDS.**

1st.	Bob the wrong produce	...	...	52436
2nd.	„ the wrong and middle	...	...	42635
3rd.	„ the wrong and home	...	...	45236

6th.	„ the middle and home	...	...	64352
7th.	„ at home	...	...	42356

To ring two courses, call as directed opposite the third or sixth-course end, and for three courses, as the first, fifth, or seventh. These three might properly be termed simple course-ends, each being produced by one bob, the others, compound course ends, being obtained by two or more bobs. To ring five courses, call as described opposite the second or fourth; the others are presented in figures, which, with the exception of the 800, are in the tittum position. Each of them are divided into three equal parts.

H. H.

The last touches are specimens of the plan for producing any given number of changes. Now the 15th course-end being 35264, it is manifest if 3-4 lay still on going off, that 45263 will be obtained by the same calling; from either of those course-ends the bells can be brought round in eleven leads, the former at back stroke and the latter at hand. Hence the dates can be rung in this method twice in sixteen years, by adopting the above course-ends to come round from; the even numbers from 35264 and the odd from 45263; the calling of each alike, the coming round excepted.

---

The following peals are on the five-part plan, which will be found useful to the young bob-caller, being more easy to retain in memory than those of longer parts.

	H.	H.			H.	H.			T.	HURRY.	

The next are divided into three equal parts; the first by the late Mr. Anable, of London, which is called by the observation of the wrong and middle, omitting the wrong when the sixth is at home, and calling a bob at home when the fifth and sixth come home, which is at the end of each 1680 changes.

				35426	- - -
				42356	- - -
				H. H.	H. H.

The following peals are constructed upon a particularly easy plan, being composed in parts of 672 changes each, as shown by the nine bob

changes annexed, which being four times repeated would come round at 3360, but by the addition of a bob at home, the part end 14235678 is produced, which twice repeated completes the peal.

10080	10080

5642837	6435827
62534 part end.	45623 part end.
H. H.	H. n.

Either of the two foregoing peals may be reduced by omitting three bobs in which the seventh is concerned in any of the courses, omitting them in four, eight, twelve, sixteen, and twenty courses, the numbers obtained will be respectively, 9184, 8288, 7392, 6496, and 5600; and omitting them in twenty-two courses, will reduce it to 5152.

## DOUBLE BOB.

What has been said of the preceding methods relative to calling short touches, will, with one exception, apply equally to this; namely, the full course, repeating four times in that, will repeat only once in this. The others producing the same number of changes, though somewhat different course-ends. Of the following touches the first is with the sixth undisturbed; the second in the tittums; and the third is on the plan of Mr. Anable's peal.

1008	W	H	1200	M	W	B	H	1680	M	W
52436	-		35264		-			54632	-	-

			25346	-	-	-		65324	-	-
								35426	-	

With the following peals, the tenors together, and one of 10080 with them parted in a similar manner to those in the plain method, which admits of being reduced to the same numbers, I conclude this method.

5040	M W H	6048	M W H	10080

## T. HURRY.

\* These nine bobs, four times repeated, would bring them round as 3360, but instead of coming round, calling a bob at home, the part end 14235678 is obtained, which, twice repeated, completes the peal.

## GRANDSIRE BOB MAJOR.

These two excellent productions are by Mr. E. Stokes, of Birmingham, each having the 6th twenty-four times wrong and twenty-four times right. For Grandsire on even numbers see p. 42.

## DOUBLE LONDON COURT BOB.

As this method is not in general practice a great variety might perhaps be deemed unnecessary ; the following will, therefore, serve as examples. The first course of the peal is given by the bob changes to show the position of the tenors, as in this peal the sixth bell cannot be removed without parting them ; the remainder will be given by the course-ends. The small numerals to the right show the number of the lead in each course where the bob is made.

## NORWICH COURT BOB.

In those peals that have the bob on the three hindmost bells, the number of the lead in each course where the bobs occur are pointed out by numerals placed to the right of the course-ends. In this method the bobs at the first, second, and fifth leads, are similar in effect to middle, wrong, and home in Double Bob Major.

## DOUBLE NORWICH COURT BOB.

The three touches in the tittums are given by the bob changes ; but the peals by the course-ends, or bob changes, such as appear most suitable to the purpose. In the 5600, by ommitting the last three bobs in any two parts, four courses will be eliminated, and the peal reduced to 5152 changes.

34256	-				34256	-	-	-		43265	-	-	

In the 5376, the sixth is at home twelve times wrong and twelve times right ; by omitting the three bobs distinguished thus,] two courses will be exterminated, and consequently, the peal reduced to 5152 changes still retaining the above properties.

In each of the other peals, with the exception of the 6048, the sixth is twenty-four times each way in the least possible number of changes. In reference to the first peal of 5184, the given part must be twice repeated ; but instead of allowing the bells to come round, a single is added when the tenors are before in the thirtieth course, thus { 18765432 } producing the { 17856432 } course-end, 24356, which being repeated completes the peal.

The next peal is similar, only a bob happening when the tenors are before in the thirtieth course, a single must be substituted.

In the 9408, a single must be added in the forty-second course, when the tenors are in the position before described, which will produce the first half-peal as in the two preceding peals.

## DOUBLE OXFORD BOB.

As the touches and peals of Double Bob (where the bob before is not used,) are equally applicable to this, it would be needless to insert peals in this method.

---

## VARIATIONS OF TREBLE BOB.

The propriety of classing the Kent method with the Oxford will be apparent from the consideration that the treble leads, bob changes, and consequently the course-ends being the same in each, and whatsoever is composed true of the latter may be applied to the former. It has been already stated that at a bob the bells above fourth's place dodge two pulls in addition to their regular work. Now as the treble uniformly dodges before and after leading her pull, which the other bells do not, it is clear that any bell dodging above fourth's place at a bob must fall into the same position as in the preceding lead; hence each bob with the tenor above fourth's place lengthens the course one lead, which must be taken into account when computing the number of changes in a peal of the above methods.

As the peals will be given by course-ends, that plan not only being more concise but more commodious than the bob changes, the following table is given; and if the practitioner makes himself acquainted with it, he will be better enabled to comprehend the structure of the various productions about to be submitted to his notice.

In the table of course-ends, and throughout these methods, the characters **M**, **B**, **W**, **H**, will indicate the places of the bobs in each course: namely, middle, out of the hunt, wrong, and home. It will, moreover, be observed, that by using the bob with the tenor out of the hunt, the same course-end will be produced differently. The latter part of the scale is, however, only adapted to eight bells, whilst that of middle, wrong, and home, serves for ten and twelve.

## TABLE OF COURSE-ENDS.

23456

	M.	W.	H.	M.	B.	W.	H.

35426	,		2	... 1	-		
54326	,		2	2 ... 1	-		2

Very few touches of these methods will be required, as a great assortment of two, three, and five courses can be obtained from the table of course-ends, as any of them will repeat once, twice, or four times, according to the number of bells transposed: and as either or both parts of the scale may be used, these will furnish an almost endless variety.

S. THURSTON.

The first peal of 5120 is remarkable for its antiquity; it is not known by whom it was composed, and is said to be the first peal of Oxford Treble Bob ever rung. Each of the 6720 peals contains the 120 course-ends; and Mr. Thurston's peal has the sixty seven-eight's before, which will conclude peals in five parts.

The next are on the three-part plan; the first having the sixth its extent wrong and right, and the second is a production by Mr. Samuel Austin, of the Society of College Youths, London, which number has not been superseded with the tenors together.

\* This peal was rung at St. Andrew's, Norwich in 1837, conducted by Mr. Samuel Thurston, and performed in 4 hours and 44 minutes.

S. AUSTIN.

Of the various lengths in these methods with the tenors parted, it may be observed, that the late Mr. Eversfield, of Gravesend, produced one of 14,016 changes, and Mr. Wright, of Leeds, Yorkshire, a peal of 15,168, which are now superseded by Mr. Thomas Day, of Birmingham, who has obtained the astonishing number of 15,648 changes, which will appear by the course-ends.

\* This peal was rung in 1848. at St. Matthew's Bethnal Green, London. by the St. James' Society. It was conducted by Mr. H. W. Haley.

T. HURRY.

H. H.

W. H.

\* This peal was rung at Trinity Church, Low Moor, in 1857, in three hours called by Josiah Barraclough.

<sup>†</sup> This peal was rung at Earlsheaton, in 1856, in 3 hours 6 minutes, called by Wm. Preston.

In each of the two following peals the sixth is at home twenty-four times wrong and twenty-four times right; and it may be remarked in reference to the 5376, that each four courses are called alike, with the exception of an extra bob when the tenor goes out of the hunt in the last course of the peal.

H. HALEY.

In each of the three foregoing peals, the fifth and sixth are made to work their extent of wrong and right, and by an examination of them, the student will see that fourteen is the least number of courses possible in which these properties can be developed.

Having inserted a variety of peals in the foregoing method, the student's attention is next directed to the process of proving peals, when he will perceive, from the peculiar difficulties attendant on Treble Bob compositions, that

many of those peals have not been obtained without considerable labour; for compositions in this method however judiciously arranged, so as to produce true treble leads, are, notwithstanding liable to be false with the treble dodging before, in three-four, five-six, and also behind when the tenors are parted.

After ascertaining the truth of the treble leads by placing the leads affected by the bobs (middle, wrong, home, &c.) under distinct heads, then proceed to prove the interior by the following proof scale. In using of which, the peal must be pricked by the back stroke treble leads, which must be read off in the same manner as the given changes are read from rounds.

## PROOF SCALE.

---

		2345678
False with treble in 1-2—		2346587
,,      treble in 3-4	{	4236587 3426587
,,      treble in 5-6	{	5436287 6432587
,,      treble in 7-8%	{	7436582 8436527

The two changes with the treble in 7-8 need not be used except in peals where the tenors are parted.

There is another method of proof, that is, by the course ends, which will only answer for peals where the tenors are kept together.

To prove by this method the course-ends which are followed by bobs in the middle must be transposed. Thus if one the middle, 43652 from 23456, and if two the middle, 63254, from 23456 and the same from every course-end, which are followed by bobs in the middle.

By this method the following are the false course-ends, 24365, 32546, 46253, from 23456, and the same from every course-end. In peals where bobs are made with the tenors before the following 53624 must also be used.

In the following intricate variations, it will be seen that Mr. Middleton has produced peals of Cambridge Surprise with the tenors together, which are also applicable to London Surprise, and are reducible to 5152, by the omission of the bobs braced. Messrs. Banister and Cox have also obtained peals with the tenors together, which may be considered an acquisition to the science, as the peals hitherto composed in these methods are with the tenors apart.

By omitting the bobs braced in the first three parts of the 6720, it will be reduced to 5376, which was rung at St. Giles's by the Norwich Scholars in 1835, called by Mr. S. Thurston.

By omitting the bobs braced in Mr. Cox's peals, each will be reduced to 5152.

\* Rung at Woolwich, in 1849, called by Mr. W. Banister.

† Rung at St. Andrew's, Norwich, in 1835, called by Mr. S. Thurston.

‡ Rung at Woolwich, in 1849, called by Mr. W. Banister.

The following are the proof scales of the preceding variations; and it may be further observed, that London Surprise, (with the tenors together,) can be expeditiously proved by the course-ends, like Oxford Treble Bob, by transposing for a bob in the middle, as in that method; the false course-ends being the same in each.

## CATERS,

OR COMPOSITIONS ON NINE-BELL METHODS.

## PLAIN BOB.

Any of the tounelies of plain on eight bells, where the bobs before are not used, may be rung on this; a similar plan of calling producing the same course-ends; the number of changes being merely augmented in the ratio of nine to seven: but as Cater ringing is not esteemed when out of the tittum position, it would be useless to say any more upon it, but commence the touches. It will be required to bring 7, 8, 9, to the position of 9, 7, 8, at the course-end. The student will perceive there are various ways of doing it: first, by calling the 9th down five leads successively; secondly, by having 7, 8, 9, in the two bobs, the first and second courses; but the most expeditious way is by calling the seventh to make fourth's place then the ninth down, and the seventh again in fourth's place: this plan brings the sixth behind the ninth, which is the most musical position possible to be obtained. A touch on each plan will be given, also one of

900, with the tittums inverted, *i. e.* at hand instead of back stroke, when the large bells will have the position 7, 9, 8, at the course-ends. These, and the two peals, will be sufficient as examples.

The most musical peals of these Caters are obtained by putting the course-ends out of course by an extra bob with the tenors before, by which means the fifth and sixth bells are behind the ninth throughout, which is exemplified in the following peals. The dashes to the left of the course ends denote bobs with the tenors before.

## GRANDSIRE.

This method is justly esteemed for the simplicity of its construction, and the harmonious effect to be produced from it. As none of its changes are out of course, it, consequently, can be brought round either at hand or back stroke without having recourse to any other means than the effect of the bobs. The following are a selection of musical touches; three of them are given by bob changes, and the others by the course-ends and bob changes united.

Round next lead. n. n.

\* 9th in and out at two leads. † First 4 bobs at the 593.

‡ 7th in and out at 2 twice.

§ 9th in and out at 3 with a double. || 8th in & out at 3

The 1188, is what is termed the inverse tittum position, it has the twelve-course-ends with the sixth before the ninth ; and the 1439, the twelve with the sixth behind the ninth ; these with the 1854, will conclude touches in this method. Of the terms adopted for calling—the ninth in and out at two, means the ninth into the hunt and out at two leads ; the eight in three, signifies a bob when she goes into the hunt and the two following leads : and by an 8, 9, should be

understood, a bob when eight-nine are together behind; the others in like manner as they occur.

The first of the following peals will be found very easy to call, from the great similarity of the parts. The last four are called alike, with the exception of the last course of the fourth part being omitted, in order to bring up a suitable course end to come round from. The second is by Mr. James Burman, which is given by bob changes.

The following peals are composed for the convenience of the bob-caller, each being in five regular parts, (with the exception of the bobs in the first course to put them in the tittums,) they being so arranged as to have the first course-end 65324. When the part is completed, if another bell is put behind the ninth, by calling the eighth in with a double, the same

\* This peal was rung at Yarmouth, in 1843, it was conducted by its composer, Mr. James Burman,

effect is produced on the five bob bells as in the first course, hence the regularity of the parts.

The last twelve courses thrice repeated; brought round as the foregoing peal.

H. H.

In the 6120 are contained the sixty eight-nine's and the sixty nine-seven-eight's, and it may be observed, that by commencing with the following two courses,

$$\left\{ \begin{array}{l} 65324789 \text{ ninth in two} \\ 42563789 \text{ ninth in two} \end{array} \right\}$$

and calling sixty courses as in the foregoing peal, the course-end 42563978 will be produced, whence by calling the ninth into the hunt and out at two leads, the number of 6245 will be obtained, having the extent of eight-nine's and nine-seven-eight's, with which this method concludes,

---

## DOUBLE GRANDSIRE.

Touches of this may be produced by employing the same bob changes as in the single method, though in some cases not with equal effect. The 575 of the single amounting to 917 on this; but as that method of calling double parts the large bells considerably, it will not for that reason be generally approved.

In touches where nine-seven-eight's and eight-nine's are called, the effect is different, that of 1151 of the single, becoming 1205 on double, keeping the large bells together; this and the following will serve as examples for calling.

629

34625 7,8  
43625 7,8  
46325789 8th & 9th  
before.

Four times repeated. H. H.

The above peal contains the sixty-course ends, but by calling two eight-nine's and a seven-eight from the third course-end of the fourth part, 42563 will be produced ; whence by calling the ninth in with a double, the result will be 5093 changes.

## STEDMAN'S PRINCIPLE.

This peal opens an extensive field of amusement to the lovers of the art of composition, affording as it does such a pleasing variety, not only by its coming round either at hand or back stroke, but, within given limits, at any desired number of changes; but to accomplish this, the going into changes must be altered from 213547698 to 214365879, which would be commencing the sixes from rounds instead of taking them from the second change; the latter method of going into changes affords greater facilities for composing various numbers, as the bells can be brought round true at any change of the six, which the former way does not admit of. Some touches on each plan will be inserted, when the experienced practitioner will have an opportunity of forming his opinion of the propriety of this alteration.

The plan usually adopted to call this into the tittums, is by a bob on seven, eight, nine, at the first six, and, doubtless, the first method that suggested itself of coming round from that position, was by two bobs on those bells after the course-end, 231456978, comes up. But there

are many ways of coming round which are not only more expeditious but also more harmonious; the following are therefore presented as examples.

Round at two changes.		

\* Bob on 7,8,9.

In the two preceding touches the bobs are indicated by the small numerals to the right of the course-ends; as there is not any place constantly called this method of representation is undoubtedly the simplest.

The following table of course-ends will assist the young practitioner to a variety of plain touches. By repeating in the manner shown in the third column, he will obtain the number of changes specified in the fourth column; thus, by a bob at the fourth six of the course, will be produced the course-end, 135426, the third, fourth, and sixth bells being undisturbed it will repeat twice, and consequently give three courses, or 324 changes; as this method is generally rung in the tittums, using seven, eight, nine, as described at page 113, each of the numbers will be augmented two courses, or 216 changes more than the tabular amount.

## TABLE OF COURSE ENDS.

367215948	<sup>3</sup>
625431789	<sup>2</sup>

The above course of bobs four times repeated come round at 1260, or quarter peal.

Nine times repeated, with the addition of two bobs at the 5th and 6th sixes of the 5th course, and a single at the fifth six of the 10th course, thus: 764981352 produce the course-end of the first half: 251456789, which being repeated completes the peal.

H. H.

The two following peals are upon a very easy plan ; the first is in the regular tittum position the second is a specimen of the tittums inverted.

## DOUBLE NORWICH COURT BOB.

The touches in this method are in the tittums, which are presented by the bob changes, the peals are by the course-ends, as the large bells are at home; but if it is preferred to ring them in the tittums, it may be done by calling two bobs on eight-nine-ten in the first and second courses, when a bob at the coming round completes the peal.

The above peals will also answer for the single method, the same bob changes occurring at a different number of the leads.

The two following peals, by Mr. Thomas Hurry, are composed with fourth's place bobs, where it will be observed that each bob has the effect of augmenting the course forty changes or two treble leads, by which means the exact numbers of five and six thousands are obtained.

In the first of the following peals the large bells are in the tittum ceters position, with the fifth and sixth behind the ninth. The second is a novel production, by Mr. John Lates, of Birmingham; the sixth being home at twelve course-ends out of the fourteen courses of which it is composed. Each of these peals present new features in these methods.

 32546 one sixth's, out, and one in seventh's.

Repeated.

\* This peal was rung at St. Peter's church, Bradford, in 1857, called by Josiah Barraclough.

The next peals are in one continued course of bobs, the first and second respectively having the sixth its extent wrong and right; the third is also of the same quality, and is in the tittum position; and in the fourth peal, the fifth and sixth are their extent wrong and right.

H. H.

\* This peal was rung in the Kent method, at St. Andrew's by ten of the Society of St. Peter's Manercroft, in 3 hours and 27 minutes, in the year 1842, conducted by the author.

In the next peal the large bells are in the tittum cathers position, and consist of the least possible number of changes in which the fifth and sixth bells can be retained their extent behind the ninth. The following are the course-ends, and the plan by which they are produced.

## 5960

764325 one middle, one 7th's, & two at home  
 324576 one middle, two 7th's, & two at home  
 542376 two wrong and two at home  
 235476 one wrong and one at home  
 453276 two wrong and two at home

 234567 in, 5th's, 7th's, and one wrong.    II. II.

As this is so near an approximation to 6000 instead of allowing the bells to come round the additional four bobs beneath will complete the number of 6480, thus :— w    II

1	1
1	1

## CINQUES,

OR COMPOSITIONS ON ELEVEN-BELL METHODS.

## PLAIN BOB.

As these Cinques are but little practised it would be useless to insert a great variety ; the first and second touches given under the head of Bob Caters, in page 102, may be applied to this, where the numbers become 836 and 1320 ; these, with a peal in the tittums, will serve as examples.

**5016**

	1	9	10
7-64235	-	-	-
52643	-	-	-
36524	-	-	-
45362	-	-	-
34562			-
25436	-	-	-
34256	-		-

The bobs at the right of the course-ends twice repeated produce 2345679x80, then a bob on 90x, thus : x098765432, completes the peal.

## GRANDSIRE.

In Grandsire ringing a multiplicity of bobs is an improvement to its music, inasmuch as a bob causes double dodging, which is a quality much admired by the best judges of the art; the touches and peals are therefore constructed upon that plan. The odd numbers are obtained by eight-nine lying still on going off, which is not only the simplest way of going into the tittums but also the one which has the best effect, as the large bells can be retained in that musical position till within a few changes of coming round.

## STEDMAN'S PRINCIPLE.

As the bobs at the 5th, 6th, 7th, 18th, and 19th sixes on Cinques produce similar course-ends to bobs applied at the 4th, 5th, 6th, 15th, and 16th on Caters, the practitioner has only to refer to the table of course-ends for calling plain touches on this; the only difference being an augmentation of the number of changes, in the ratio of twenty-two to eighteen, or, in lowest terms, as eleven to nine. As an example of this, let the 5076 of Caters be transferred to Cinques, and we shall have

$$\frac{11 \times 5076}{9} = 6204 \text{ changes.}$$

The first of the following peals, which consists of 5014 changes, was rung upon handbells (retained in hand)\* by six members of St. James's Society, London, on the 10th of Feb., 1851. This extraordinary performance occupied 3 hours and 28 minutes. The truth of it was attested by several scientific persons: it was conducted by Mr. H. Haley, and rung as follows:—

H. Haley, treble and 2nd	M. A. Wood, 7th & 8th.
J. Cox, 3rd and 4th	W. Cooter, 9th & 10th
G. E. Ferris, 5th and 6th	J. Dwight, 11th & tenor.

\* This will be understood in future, as no unscientific mode of ringing will be noticed.

613452	19
316254	6, 19
314652	19
312456	19

The eleven courses thrice  
repeated produce

214563                  H. H.

614325	5, 6, 19
416523	6, 19

Omitting one 1, 3, or 5 braces the numbers will  
be respectively 6069, 5277, and 5013.

In the two following touches the four large  
bells are in the same position as the preceding  
by bobs only, consequently they come round at  
back stroke.

528

## MAXIMUS,

OR COMPOSITIONS ON TWELVE-BELL METHODS.

## PLAIN BOB.

It would be superfluous to insert touches of this Maximus, as any required number of courses of the corresponding methods on eight or ten bells can be applied to it, the course-ends of each being similar. The same observation holds with respect to the succeeding methods. Peals of 5000 and upwards, will therefore be proceeded with.

5016

			56234	-	.

Each four times repeated. H. H.

If the three bobs braced are omitted, the number of changes will be reduced to 6072, and if omitted in any three parts the result will be 5016.

---

## SINGLE AND DOUBLE COURT,

WITH

## SINGLE AND DOUBLE NORWICH COURT.

Either of the two following peals will serve for the first and fourth methods, the bob changes being the same in each, notwithstanding they occur at a different number of the lead. And the third peal will answer for either the second or third methods of Court.

Round at 2 leads

These came too late for insertion under their  
proper heads.

Having inserted a copious variety in the most practical systems, I shall in conclusion, endeavour to show the young practitioner the method of ascertaining whether a course-end is in or out of course, simply by a knowledge of the three following, with five-six at home :

42356

34256

23456

Adopting the hypothesis in page 43, it will appear, if the assumed course-end comes to one of those, by bringing five-six home, it is in course; if not, it must be out of course. Let any course-end be assumed :—

46532

transposed 42356 this coinciding with those above given, shows 46532 to be in course. Now let any other be assumed :— 63524

transposed 43256 this being contrary to the given course-ends, shows 63524 to be out of course. If five-six cannot be brought home the first transposition the process must be repeated.

These course-ends which are now found by trial, will soon become familiar at sight. This principle extends further,—it frequently happens in Stedman ringing, that the treble is involved in the course-end; in that case, if it falls into an odd bell's place, the other figures read as in the preceding: but if it falls into an even bell's place, the course-end must be considered contrary; this will be evident by the following example:

123456 in

213456 out

231456 in

234156 out

234516 in

234561 out

Hence it appears that a knowledge of the 720 course-ends is as easily attainable as that of the 120, which is a matter of considerable importance in the business of composing and conducting peals. In the same manner it may be proved whether any given change is in or out of course, simply by transposing by four, or any multiple thereof.

# LINES

BY S. NOBBS,

*Late of the Society of Norwich Scholars.*

How oft mankind exert their utmost powers  
To find amusement for their leisure hours ;  
While some in bowls or cricket will unite,  
And in such healthful exercise delight,  
Others on chess or musie fix their mind,  
Requiring practice of no trifling kind :  
Those who are gifted with a tuneful voice,  
In singing glees or such like strains rejoice :  
While some to far less noble arts descend—  
Their time thus wasted oft in ruin end.  
Then why should ringing be set down as naught  
By those who never gave the science thought ?  
Its exercise amusement doth impart  
To those who are proficient in the art :  
In it our energies are all required—  
Mental and physical, and zeal untired.  
Its compositions intricate are found ;  
While in its changes harmony abound.  
Then let despisers who the art condemn,  
Leave us to follow it—we grant their choice to them.

Extract from the GLOCKEN RUNDE, 1858, by H. OTTE.

"Messrs. Mears, Bellfounders, Whitechapel, London, successors to Messrs. Rudhall of Gloucester, have surpassed, in the ability they have displayed all the Bell-founders ever known. The celebrated Messrs. Rudhall themselves had founded from 1684 to 1774 no less than 3695 bells, but Messrs. Mears & Co. are carrying on their business on a larger scale at their Establishment, where hundreds of bells are founded every year, and where it is not unusual to see as much as 15 to 20 tons of metal in the furnace."
